Constituency-level fixed effects regression, dependent variable is share of the vote for the Conservative Party. All models include constituency and election fixed effects, (2) and (4), (6), and (8) add manufacturing employment in 1880 interacted with election dummies. (7) and (8) use a panel matched on Conservative vote share in 1885, 1892, and 1900. Standard errors clustered by county in parentheses.

Newspaper-level regressions. Dependent variable is the number of references to “unemployed,” “unemployment,” and “employment,” minus the number of references to “vagrants,” “vagrancy,” “pauper,” and “pauperism,” standardized. All models include newspaper and year fixed effects. For newspapers in cities, ΔIPW is calculated at the city-, not constituency-level. Standard errors clustered by county in parentheses.

Stacked first difference estimates, at the constituency level, for 1880–1890, 1890–1900, 1900–1910. Dependent variable is change in average economic status. All models include year fixed effects. (2)–(4) add controls for lagged manufacturing employment and lagged average economic status; (3) includes 1880 manufacturing employment interacted with year dummy variables, (4) includes constituency fixed effects, which adjust for constituency-specific time trends. Standard errors clustered by county in parentheses.

Note:

*p<0.1; **p<0.05; ***p<0.01

Constituency-level fixed effects regression, dependent variable is share of the vote for the Conservative Party, for the period 1900–1910. All models include constituency and election fixed effects, even numbers add manufacturing employment in 1880 interacted with election dummies. Models 1 and 2 in addition control for exports to Germany per worker, computed the same way as ΔIPW , models 3 and 4 control for US wheat imports per worker, with wheat employment calculated using agricultural laborers weighted by the share of county land devoted to wheat cultivation. Standard errors clustered by county in parentheses.
